

M E M O R A N D U M

TO: DICK BURKHALTER

October 12, 1971

FROM: NORM THOMAS

SUBJECT: Grays Harbor Data

Contained in this memo is the summarization of data collected on Grays Harbor and in the Chehalis River, in cooperation with Weyerhaeuser Company of Cosmopolis and ITT Rayonier, Moquiam. The inclusive dates of this summary are from 22 July 1971 through 30 September 1971, during the Chehalis River low flow period of this year.

Included in the data is the 1971 Cooperative Comprehensive Survey. The sampling period commencing on 16 August 1971 and ending on 20 August 1971.

The following parameters reported are for the entire reporting period. They are:

dissolved oxygen (DO), biochemical oxygen demand (BOD), pH, PSI, DO percent saturations, river flows, and tides. The remaining parameters are reported during the comprehensive survey only: algae cell count, weather, and helixor operation.

The Weyerhaeuser Company mill was down on strike at the beginning of this reporting period, and did not begin discharging until August 26, 1971.

ITT Rayonier was requested to discharge 60,000 lbs. of BOD per day during the comprehensive survey. Because of being in a startup situation and problems with their recovery plant, they were not able to maintain this level of discharge.

During the preliminary survey in July, two new sampling stations were established (light 6 and light 8) to better define the DO recovery area.

Included in this memo is a table listing the operational time of the helixors installed by the Port of Aberdeen, a device utilizing compressed air to prohibit silt from settling out at Terminal 4, about 500 yards west of Station 685. The helixors are only operated when the tide stage is below about 6 feet. Hence, they were not run during any of the high tide sampling, although there was a hard hat diver working on the helixors at the times indicated during sampling periods.

On August 16, 17, and 18, there was a dredging operation at Anderson-Middleton Pier. The spoils being disposed of on the land. This Pier is about 100 yards northwest from Station No. 33.

Observations made during the sampling and laboratory analyses periods should be discussed with the respective industry.

Memo - Dick Burkhalter

At the time of analysis, it was noted that ITT Rayonier uses the colorimetric method for determining the pH value. Standard Methods states that this method is suitable only for rough estimates. Weyerhaeuser Company uses a pH meter, but stated that they buffer the instrument only about once a week. Most instruction manuals for pH meters suggest that the instrument be buffered immediately before and after a series of samples to be as certain as possible of the best results.

The sampling technique of ITT Rayonier was questioned in regard to DO values of the surface samples in that they would take the sample prior to the dissipation of the wheel wash set up from the tug being in the reverse position. This problem was discussed with Dee Johnson.

At a meeting held with Weyerhaeuser Company, ITT Rayonier, and the Department of Ecology, it was agreed that the tentative date for the 1972 survey would be the week of the 20th to 24th in August, 1972.
